

1. A liquid dispensing valve comprising:
 - a valve body having a liquid inlet, a liquid outlet, an interior liquid chamber in communication with said liquid inlet and said liquid outlet;
 - a valve seat positioned in said valve body;
 - a valve member mounted for reciprocating movement in said liquid chamber between a closed position engaged with said valve seat to prevent liquid from exiting through said liquid outlet and an open position disengaged from said valve seat to allow liquid to flow through said liquid outlet;
 - a calibration device coupled with said valve member comprising a rotatable reference ring having a first zero reference indicator and additional indicia thereon for indicating incremental increases in stroke length of said valve member, and a rotatable stroke control stop member having a second zero reference indicator and capable of being rotated to change the stroke length of said valve member between zero and a maximum stroke length, wherein said first and second zero reference indicators may be aligned after said stroke control stop member has been adjusted to set the stroke length at zero and, thereafter, said rotatable stroke control stop member may be rotated relative to said reference ring to set the desired stroke length between zero and the maximum stroke length.

2. The dispensing valve of claim 1, further comprising:

 a piston coupled for reciprocating movement with said valve member, said piston having first and second sides, aid first side stopping against said stroke control stop member when said valve member is in the open position and an air chamber positioned on said second side for receiving pressurized actuation air operative to move said piston and said valve member to the open position.

3. The dispensing valve of claim 2, further comprising:

 a compression spring acting on said first side of said piston and capable of moving said piston and said valve member to the closed position upon exhaustion of the pressurized actuation air from said chamber.

4. The dispensing valve of claim 3, wherein said stroke control stop member is positioned within said compression spring.

5. The dispensing valve of claim 1, further comprising:

 a frictional member positioned in engagement with said reference ring and said stroke control stop member and operative to prevent inadvertent further rotation of said reference ring and said stroke control stop member after setting the zero reference point and the desired stroke length.

6. The dispensing valve of claim 5, wherein said frictional member further comprises an O-ring.

7. A liquid dispensing valve comprising:
- a valve body having a liquid inlet, a liquid outlet, and interior liquid chamber in communication with said liquid inlet and said liquid outlet;
 - a valve seat positioned in said liquid chamber;
 - a valve member mounted for reciprocating movement in said liquid chamber between a closed position engaged with said valve seat to prevent liquid from exiting through said liquid outlet and an open position disengaged from said valve seat to allow liquid to flow through said liquid outlet;
 - a first fluid fitting having a first sealing portion and a first connecting portion, said first fluid fitting positioned in fluid communication with said liquid inlet;
 - a first seal positioned between said valve body and said first fluid fitting; and
 - a clamp plate removably secured to said valve body and clamping said first sealing portion of said first fluid fitting against said first seal with said first connecting portion adapted to couple with a liquid conduit.

8. The liquid dispensing valve of claim 7, wherein said first connecting portion further comprises a first barbed portion for coupling with a flexible liquid conduit.

9. The liquid dispensing valve of claim 7, wherein said valve body further comprises a process air inlet for directing air to a location proximate said liquid outlet, and further comprising:

a second fluid fitting having a second sealing portion and a second connecting portion, said second fluid fitting positioned in fluid communication with said process air inlet; and

a second seal positioned between said valve body and said second fluid fitting,

said clamp plate clamping said second sealing portion of said second fluid fitting against said second seal with said second connecting portion adapted to couple with an air conduit.

10. The liquid dispensing valve of claim 9, wherein said second connecting portion further comprises a second barbed portion for coupling with a flexible air conduit.

11. A method of calibrating the stroke length of a liquid dispensing valve which comprises a valve member movable along a stroke length between open and closed positions and a calibration device operative to set the stroke length, the calibration device having a rotatable stroke control stop member with a stroke length reference indicator thereon and a rotatable reference ring with a plurality of stroke length reference indicators thereon, the method comprising:

rotating the stroke control stop member into operative engagement with the valve member in the closed position thereby preventing movement of the valve member toward the open position;

rotating the reference ring to align its zero stroke length reference indicator with the zero stroke length reference indicator on the stroke control stop member; and

rotating the stroke control stop member out of engagement with the valve member such that the stroke length reference indicator on the stroke control stop member aligns with a desired one of the plurality of stroke reference indicators on the stroke reference ring to set and indicate the stroke length of the valve member.

12. The method of claim 11, wherein the valve member further comprises a piston coupled to a valve stem, and the steps of rotating the stroke control stop member respectively further comprise rotating the valve member into and out of engagement with the piston.
